Access review gone wrong: Spot the red flags.

As part of a quarterly access review, each department head is tasked with reviewing access for their team members. Tyrell, the IT admin, is responsible for pulling access logs from Okta, compiling user access reports, and assigning reviewers across the department using a shared spreadsheet.

Scenario: Tyrell downloads the full user access report from Okta and distributes it via email to each department lead. He reviews the IT department access, himself and notices he still has the following:

-support admin access in Okta;

-admin access in Google Workplace; bullet point,

- admin access in LastPass.

Since he has been working overtime lately, Tyrell goes ahead and signs off on the IT team's access, including his own, without a full review. He recalls that Jared, the UX designer, transferred to the marketing team last month, but leaves him listed under IT because he might still need access to some IT resources.

Additionally, the spreadsheet shows that Raj, the CEO, has all tool access, but there is no record of when that was last reviewed. No one is assigned to review Raj's access, so it's marked as N/A in the review log. Later, the GRC manager, Naomi, receives the sign-off spreadsheet and archives it in a shared Google Drive folder titled "Completed Review," which is open to anyone at the company. List all the problems or risks you can identify in the access review process above.

Explain why each one is risky and provide a recommendation for how to fix this
